A PRODUCT DESIGNER / BUSINESS ANALYST

With 7 years of experience

TURNING RESEARCH INTO PRODUCTS

ACROSS HEALTH, FINANCE, EDUCATION,
SECURITY, SOCIAL IMPACT AND MORE.

STUDIO DITO · FORTALEZA

Design services *for digital products*

The official portfolio of Studio Dito and Espedito Roza, featuring documented case studies in user research, digital products, interfaces and design systems.

01 · Strategy & product

Product & UX Design

User research, information architecture, prototyping, testing and design systems.

02 · Digital presence

Web Design

Responsive, accessible websites built for conversion, content and organic discovery.

03 · Teaching

Classes

UX/UI Design at The Starter and Artificial Intelligence in a UFC extension program. Custom workshops too.

Selected Works *and Case Studies*

CREATING A DESIGN SYSTEM FOR 150+ HOSPITALS

Clio Design System

Design system for the largest private healthcare provider in Brazil. Continuously expanding beyond 150 hospitals, reaching the entire network.

PROBLEM

Hundreds of internal web products were developed by separate teams with no shared visual or interaction vocabulary. The result: inconsistency across the different flows of the same platform.

SOLUTION

Clio is now the UI foundation for all of the nurses' and doctors'

PROCESS

Integrated a team of 4 designers to define global tokens and document design rules in a design system. This design system is the base for 3 different medical contexts (emergency, hospitalization and elective). Established a governance model so each product contributes back to the library.

UX & ACCESSIBILITY

Components designed with hospital peers as primary users to

guarantee that all the specific requirements for each flow were followed. Clio has a responsive layout, minimum WCAG AA contrast and is optimized for clinical efficiency.

60+ documented components

SIMPLIFYING NAME RECTIFICATION FOR TRANS PEOPLE

Re.tifica

Mobile app and web platform that simplifies name and gender rectification for trans and travesti people in Brazil.

PROBLEM

In Brazil, rectifying name and gender in the civil registry involves a bureaucratic process across states. The 11 interviewed people experienced discomfort with their registered name since childhood and described the process as 'bureaucratic', 'slow', and 'expensive'.

SOLUTION

An intuitive, step-by-step platform that demystifies the legal bureaucracy. It provides personalized checklists for required documents, cost estimations, fee waiver templates. To make the process less overwhelming, I designed a gamified flow where each step is named after a famous trans pioneer, breaking down complex requirements into manageable achievements.

OUTCOMES

11 in-depth interviews

User testing on 5 participants

Custom design system delivered

PROCESS

Using Garrett's 5 Planes as a strategic foundation, I conducted 11 in-depth qualitative/quantitative interviews to map user pain points and build empathy models. After benchmarking regional legal guides and international apps, I established a custom design system to prototype a comprehensive web and mobile solution.

UX & ACCESSIBILITY

The communication is centered on a neutral and inclusive language that doesn't assume gender across the legal process. This user-centered interface was validated by user testing, achieving a 92.5 average SUS score. Feedback drove some iterations and finally, a comprehensive handoff of flows and component states ensured the developer transition.

SUPPORTING TRANS MEN
THROUGH HORMONE THERAPY

Ariel

Mobile application to support trans men in discovering, deciding, and tracking

hormone therapy.

PROBLEM

Navigating Hormone Replacement Therapy (HRT) is a complex and highly personal medical journey, often marked by a lack of accessible clinical guidance. Trans men lacked a dedicated, reliable digital health tool to safely track dosages, monitor physical/emotional effects, and access curated medical information throughout their transition.

SOLUTION

The solution is a holistic medical tracking app designed specifically for the trans experience. It bridges the gap in clinical care by providing users with a private, secure environment to log hormone injections, track emotional health trends, and consume reliable medical literature.

OUTCOMES

SUS = 87.9 (ideal threshold: 68)

0/6 users scored below the threshold

162-page technical report (in Portuguese)

PROCESS

The strategy was rooted in rigorous medical and user research, triangulating data from academic papers, competitor health apps, and direct patient interviews. This mixed-methods approach drove the creation of high-fidelity mockups and emotional design concepts, which were tested and refined with users.

UX & ACCESSIBILITY

Designed to replicate an empathetic conversation rather than a cold medical form, the UI relies on emotional design to foster positive habits. The animated syringe acts as a key motivational tool, offering immediate visual feedback for logged doses. This approach was successfully validated in testing sessions with six users, including a healthcare professional specializing in trans health.

A MOBILE GAME FOR RAISING AWARENESS ABOUT ANIMAL ABANDONMENT

Clube do Resgate

Geolocated mobile game with gamification elements for raising awareness about animal abandonment. 3rd place at the XVIII Brazilian Symposium on Human Factors in Computing Systems.

PROBLEM

The staggering scale of animal abandonment in Brazil— affecting 30 million animals—often leads to public apathy rather than action. Existing physical shelters and feeding stations needed a modern, digital storytelling layer to re-engage an indifferent public and convert them into

PROCESS

The strategy centered on behavioral design. After mapping the motivations of different users via surveys and interviews, the Octalysis Framework was applied to create habit-forming mechanics. The emotional resonance of these mechanics was tested and proven using the MAX cards method.

active participants.

SOLUTION

A pioneering 'phygital' mobile game that seamlessly connects the digital and physical worlds. The app integrates real-world feeding stations with a digital RPG environment where players battle 'Shadows of Abandonment.' This immersive loop effectively bridges the gap between virtual engagement and real-world animal adoption.

UX & GAME DESIGN

The user experience transforms the topic of animal abandonment into an empowering journey. Through strategic game design, users are guided from casual gameplay to high-engagement advocacy, maintaining an intuitive interface. This has been validated by 10 users via MAX cards.

OUTCOMES

🏆 3rd place at IHC 2019

510 survey participants

10 users in final tests

TEACHING SIGN LANGUAGE TO
HEARING CHILDREN

Gestus

Educational computer game that teaches Brazilian Sign Language to hearing children. 191 children played the game in 2019.

PROBLEM

Despite Brazil having 9.7 million people with hearing impairments, a deep communication gap persists. As demonstrated in a survey of 134 university students, almost half of them had never encountered Brazilian Sign Language (LIBRAS). LIBRAS is also the second official language of Brazil. The core problem was finding a way to introduce sign language early, making it an engaging and natural part of childhood.

SOLUTION

An immersive desktop game that turns education into entertainment. As players guide Jonas through various city modules, they unlock new LIBRAS vocabulary. The solution utilizes looping sign animations and immediate visual rewards to reinforce learning without feeling like a traditional classroom.

PROCESS

The research was split between understanding deaf community barriers (visiting communities of deaf people) and decoding children's media preferences. By analyzing trends from games like Roblox and Minecraft, Gestus was designed with core personas and continuously validated the mechanics through extensive testing with 191 children.

UX & ACCESSIBILITY

Child-friendly typography ensures high legibility, while specific palette colors intuitively guide the user. Looping animations of signs help the understanding of the signs, since the children repeat the signs as an action of learning.

OUTCOMES

191 children tested in 2019

90% reported greater motivation to learn LIBRAS

Became an Enactus UFC Project

**SIMULATING HEALTH PLAN
COSTS FOR HR MANAGERS**

Co-payment Simulator

B2B sales funnel tool for a health plan operator that enables company HR managers to simulate co-payment costs per employee and supports PAX's commercial pipeline.

PROBLEM

PAX needed an effective B2B strategy to capture new corporate leads. Meanwhile, HR managers struggled to simulate co-payment costs using scattered Excel spreadsheets. The challenge was creating a valuable, free utility that solved this HR pain point while functioning as a powerful lead-generation tool.

SOLUTION

The simulator functions as a 24/7 digital sales representative. It replaces outdated Excel workflows with a responsive, 1280x720 desktop experience. By flawlessly guiding HR professionals through complex financial forecasts, it captures highly qualified corporate leads for PAX's commercial pipeline.

OUTCOMES

Functional Prototype

Corporate design system reuse

PROCESS

Structured the experience around the data using the same design system created for this client, ensuring consistency across all elements and simplifying implementation for the development team.

UX & ACCESSIBILITY

The UX strategy successfully masks the complex mathematics of co-payment variables behind a clean, approachable interface.

NDA

Additional details

In addition to the simulator, I designed the full internal management system used by PAX's operations team, including HR and employee-management views. This work cannot be shared publicly due to a non-disclosure agreement signed at Intmed Software.

Meet *Espedito Roza*

I come from a place where improvisation is a form of intelligence. Where people don't wait for the system to work. They work around it. That's the design problem I've been studying my whole life, even before I had the vocabulary for it.

Over the last seven years, I've worked across education, finance, health, and security, with startups, public institutions and multinational companies. I've run usability tests, facilitated workshops, built design systems, led teams and taught UX to people who were just starting out.

I hold a degree in Digital Systems and Media from UFC and a postgraduate qualification in UX Design from PUC-RS. At university, I led 39 students in projects aligned with the UN Sustainable Development Goals. A work that earned us the national ODS 8 award.

Today I teach UX/UI Design at [The Starter](#), the largest UX school in Portugal, and Artificial Intelligence at UFC. Studio Dito is my independent UX and Product Design studio in Fortaleza. Through the studio, I conduct user research, design interfaces, build design systems and work with clients in Brazil and the United States.

I design products. And I also investigate what they reproduce.

Let's create together!
